SOLANA MOBILE · DEVNET

ClockIn

Escrow, encrypted collaboration and portable reputation for freelance work. On your phone, on Solana.

Lock funds. Do the work. Get paid and reviewed in one transaction.

Timothy Adewuyi · CLOCK IN Hackathon, October 2026 · Live on Solana Devnet

The problem

Freelancers do the work first, pay 10–20% to a platform, and still don't own their reputation.

Ada

Designer · Lagos

214 five-star reviews on one platform

0 anywhere else

1

Payment risk

Someone always goes first. Either the worker delivers unpaid, or the client pays unseen.

2

The platform cut

Upwork takes 10% from freelancers; Fiverr takes 20%.

3

Locked reputation

Hundreds of reviews, and none of them leave the platform that holds them.

Solution

ClockIn replaces the middleman with a contract both sides can verify.

01 Escrow you can see

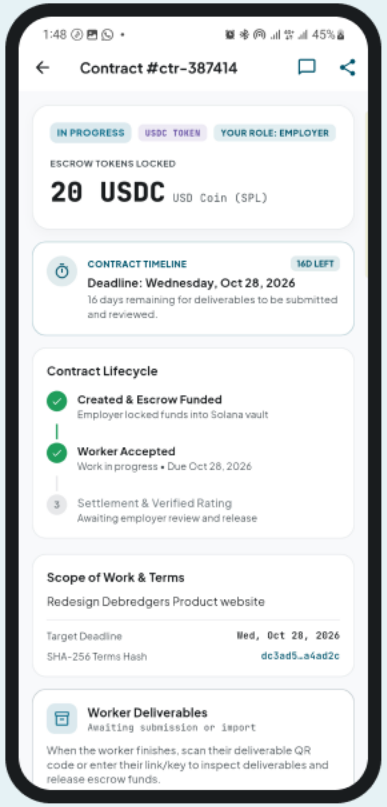

The client locks SOL, USDC or $SKR in an on-chain vault before work starts. Nobody holds the money.

02 Private collaboration

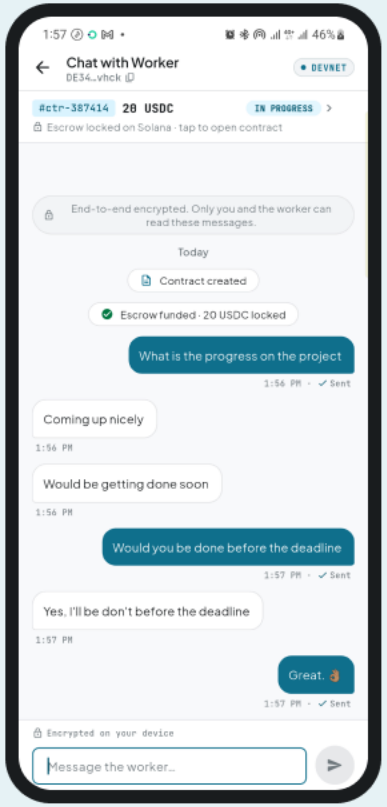

Chat and deliverables are end-to-end encrypted between the two parties.

03 Reputation that travels

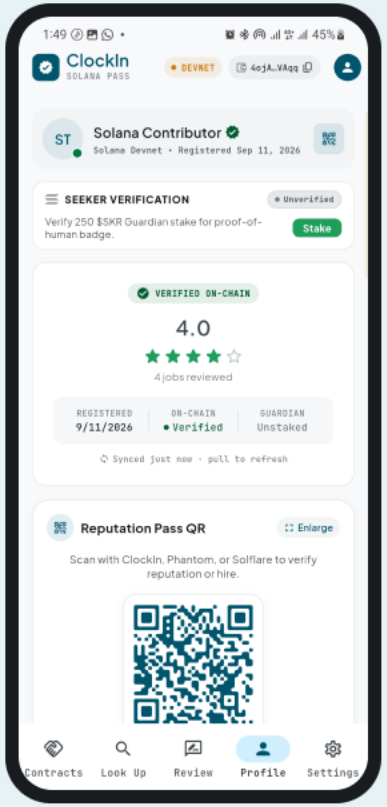

Each settled contract writes a review to the worker's wallet, readable by any app.

Funded contract

Encrypted chat

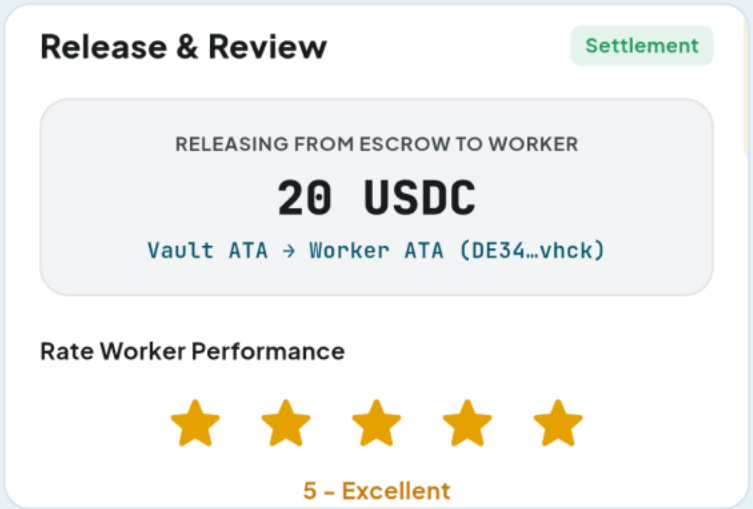

Reputation

The core idea

Payment and review happen in the same transaction, so every review is backed by a settled payment.

01 Lock funds → 02 Accept → 03 Deliver (encrypted) → 04 Release & review → 05 Reputation updated

One signature.

Funds move to the worker and the review is recorded together, or neither happens.

Why Solana Mobile

Built for the phone in a freelancer's hand, not ported from a browser extension.

Mobile Wallet Adapter

Every action is signed in the user's own wallet app. ClockIn never holds a key.

Seeker-aware

Detects Seeker hardware and reads a wallet's real $SKR Guardian stake to show a proof-of-stake badge.

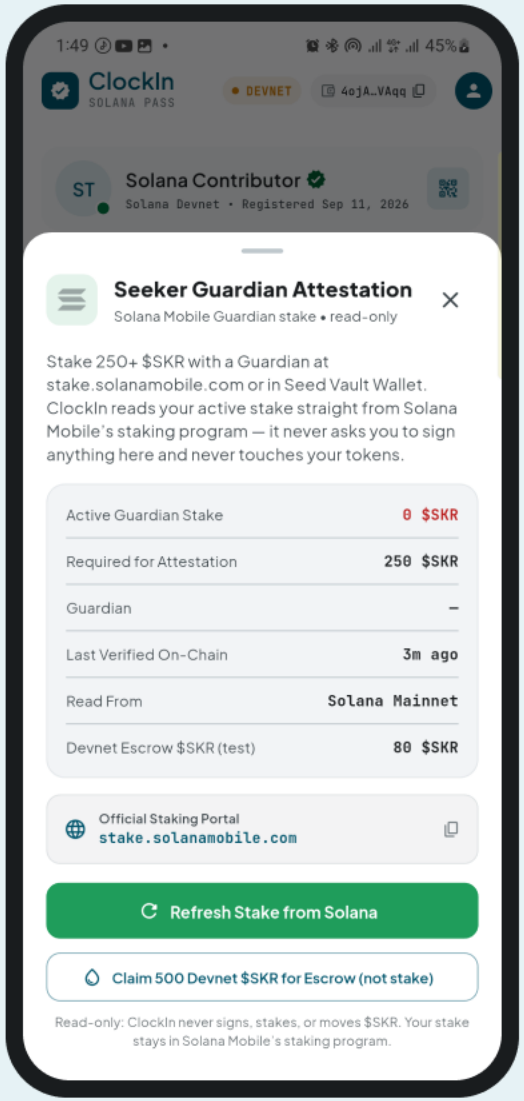

Works on a bad connection

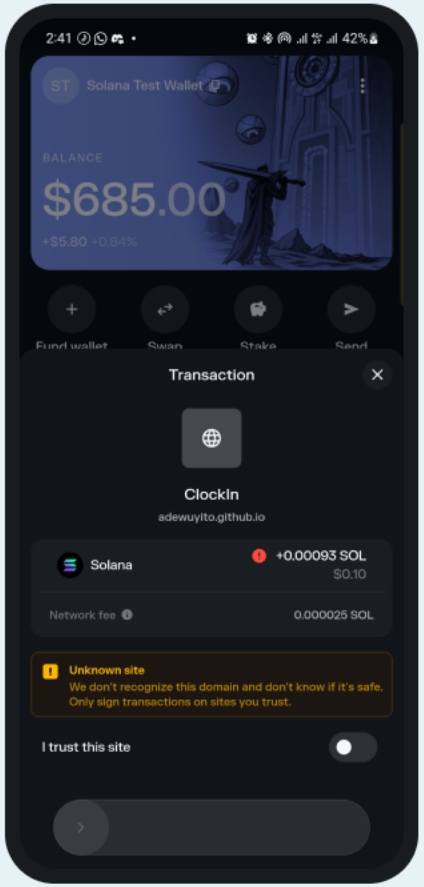

Local cache, offline drafts, queued chat messages.

QR everywhere

Scan a wallet, a Solana Pay code or a contract link; share your reputation pass in person.

`150,000+ Seeker pre-orders · 57 countries · 0% dApp Store fee`

What's built

A deployed program and a tested app, not a prototype.

20
on-chain instructions, live on Devnet

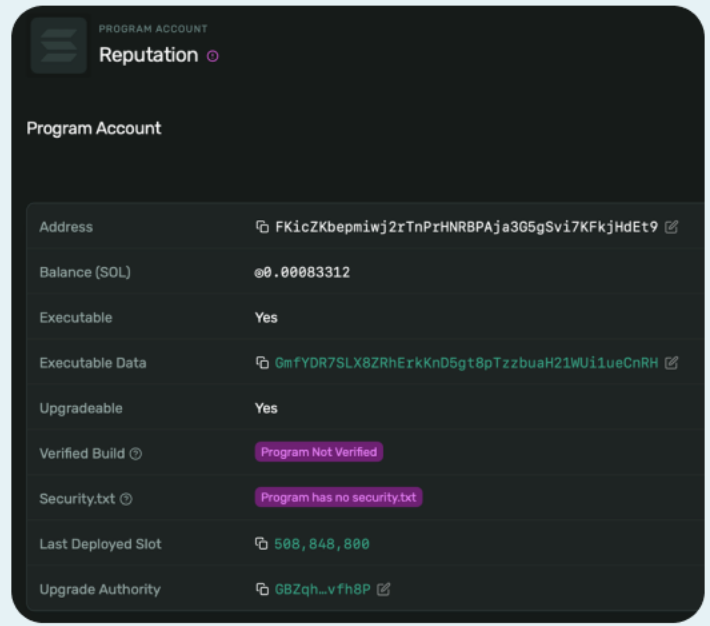

3
currencies: SOL · USDC · $SKR

239
automated tests passing (39 program · 167 app · 33 security rules)

11
app screens, built from one design system

0
private keys held by the app

2
Android phones tested, down to a 5-inch screen

Who it's for

Start where crypto-native work already happens, then widen.

WHO IT'S FOR

First users

Solana builders, bounty hunters and DAO contributors already paid in SOL and USDC.

Next

Cross-border freelancers for whom stablecoin settlement beats a 3–5 day wire.

Context

Online gig work is a ~$500B-a-year market with 150–435 million workers (World Bank).

HOW IT SUSTAINS ITSELF

Planned

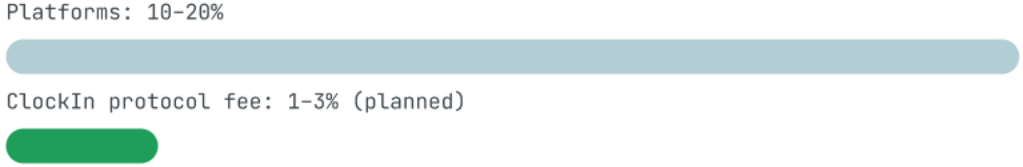

A 1–3% protocol fee on each settled contract.

How it's collected

The program takes it in the same transaction that pays the worker. No payment processor, no invoicing.

Later

Paid reputation lookups for hiring platforms and DAOs.

Honest scope

What's live, what isn't yet, and the order we'll fix it.

NOT YET

- Devnet only; no real funds.
- Disputes settle between the two parties. Community jurors are built but switched off until juror selection is fair.
- Reviews are payment-backed, not yet weighted against a user paying themselves.
- Review notes are stored on Irys's test network; permanent storage comes with mainnet.

NEXT

1. Solana dApp Store submission (signed release build).
2. Security audit and multisig upgrade authority.
3. Juror selection from $SKR Guardian stakers.
4. Milestone contracts and the protocol fee.
5. Mainnet.

ClockIn

Help us put ClockIn in front of the people it's for.

01 Try it

Scan to install the APK and settle a contract on Devnet.

02 Pilot it

Run one real bounty or grant through ClockIn escrow: Superteam, RadiantsDAO, hackathon organisers.

03 List it

Guidance on the Solana dApp Store submission for Seeker.

Scan to install

Android app, 31 MB. Solana Devnet only, no real funds.

Appendix A1

ClockIn vs. platforms

	Upwork / Fiverr	ClockIn
Fee	10–20%	0% today; 1–3% planned
Settlement	Days, after a holding period	Seconds, on release
Currencies	Fiat	SOL · USDC · $SKR
Who holds the money	The platform	An on-chain vault controlled by the program
Messages and files	Readable by the platform	End-to-end encrypted
Disputes	Platform decides	Both parties must agree to a split
Reviews	A row in a private database	A public on-chain record tied to the worker's wallet

Appendix A2

How the encryption works

- Each wallet signs a one-time message that binds it to a device encryption key (X25519). Counterparties verify that signature before trusting the key.
- Chat: both phones derive the same per-contract key; messages are AES-256-GCM with the contract, sender and time authenticated. The server stores ciphertext only.
- Deliverables: encrypted on the worker's phone; the key is wrapped for the client alone. A SHA-256 hash proves the file wasn't changed.
- Limit: chat messages are not individually signed yet, so chat is not dispute evidence.

Appendix A3

How disputes work

- Either party can raise a dispute; funds stay locked.
- Outcomes: release to worker, refund to client, or a 50/50 split. A split executes only if the other party accepts the proposal; the proposer can withdraw it.
- Juror arbitration (3-juror quorum) exists on-chain behind a flag, disabled until jurors are selected by the protocol rather than by the parties.

Appendix A4

Reputation and fake reviews

- An escrow-linked review requires a funded contract that settled. The amount and both wallets are public.
- Known gap: with no fee, someone can pay their own second wallet cheaply.
- Planned defences: the protocol fee (makes it cost money), weighting by amount and counterparty diversity, and the Seeker stake badge as a proof-of-person signal.

Appendix A5

Architecture at a glance

- Anchor program (Rust) on Solana Devnet: profiles, reviews, SOL and SPL-token escrow, disputes.
- Flutter app for Android: Mobile Wallet Adapter signing, Riverpod state, Drift SQLite cache (schema v13).
- Firestore as untrusted transport for encrypted chat, deliverable envelopes and the key directory; 33 rule tests.
- Irys for review notes and deliverable ciphertext; live SOL price from Jupiter with CoinGecko fallback.
- One mainnet read only: the wallet's $SKR Guardian stake, for the Seeker badge. No mainnet writes, no keys.
